¹ AAIJ 17AD report $m_{J/\psi} - m_{\eta_c}(1S) = 110.2 \pm 0.5 \pm 0.9$ MeV. We use the current value $m_{J/\psi} = 3096.900 \pm 0.006$ MeV to obtain the quoted mass.

² From a fit of the $\phi\phi$ invariant mass with the mass and width of $\eta_c(1S)$ as free parameters.

³ AAIJ 15BI reports $m_{J/\psi} - m_{\eta_c}(1S) = 114.7 \pm 1.5 \pm 0.1$ MeV from a sample of $\eta_c(1S)$ and J/ψ produced in b -hadron decays. We have used current value of $m_{J/\psi} = 3096.900 \pm 0.006$ MeV to arrive at the quoted $m_{\eta_c}(1S)$ result.

⁴ Taking into account an asymmetric photon lineshape.

⁵ With floating width.

⁶ Ignoring possible interference with the non-resonant 0^- amplitude.

⁷ Using both, $\eta \rightarrow \gamma\gamma$ and $\eta \rightarrow \pi^+\pi^-\pi^0$ decays.

⁸ From a simultaneous fit to six decay modes of the η_c .

⁹ Accounts for interference with non-resonant continuum.

¹⁰ Taking into account interference with the non-resonant $J^P = 0^-$ amplitude.

¹¹ From a fit of the J/ψ recoil mass spectrum. Supersedes ABE,K 02 and ABE 04G.

¹² Using mass of $\psi(2S) = 3686.00$ MeV.

¹³ Not independent from the measurements reported by LEES 10.

¹⁴ MITCHELL 09 observes a significant asymmetry in the lineshapes of $\psi(2S) \rightarrow \gamma\eta_c$ and $J/\psi \rightarrow \gamma\eta_c$ transitions. If ignored, this asymmetry could lead to significant bias whenever the mass and width are measured in $\psi(2S)$ or J/ψ radiative decays.

¹⁵ From the fit of the kaon momentum spectrum. Systematic errors not evaluated.

¹⁶ Superseded by LEES 10.

¹⁷ From a simultaneous fit of five decay modes of the η_c .

¹⁸ Superseded by VINOKUROVA 11.

¹⁹ Weighted average of the $\psi(2S)$ and $J/\psi(1S)$ samples. Using an η_c width of 13.2 MeV.

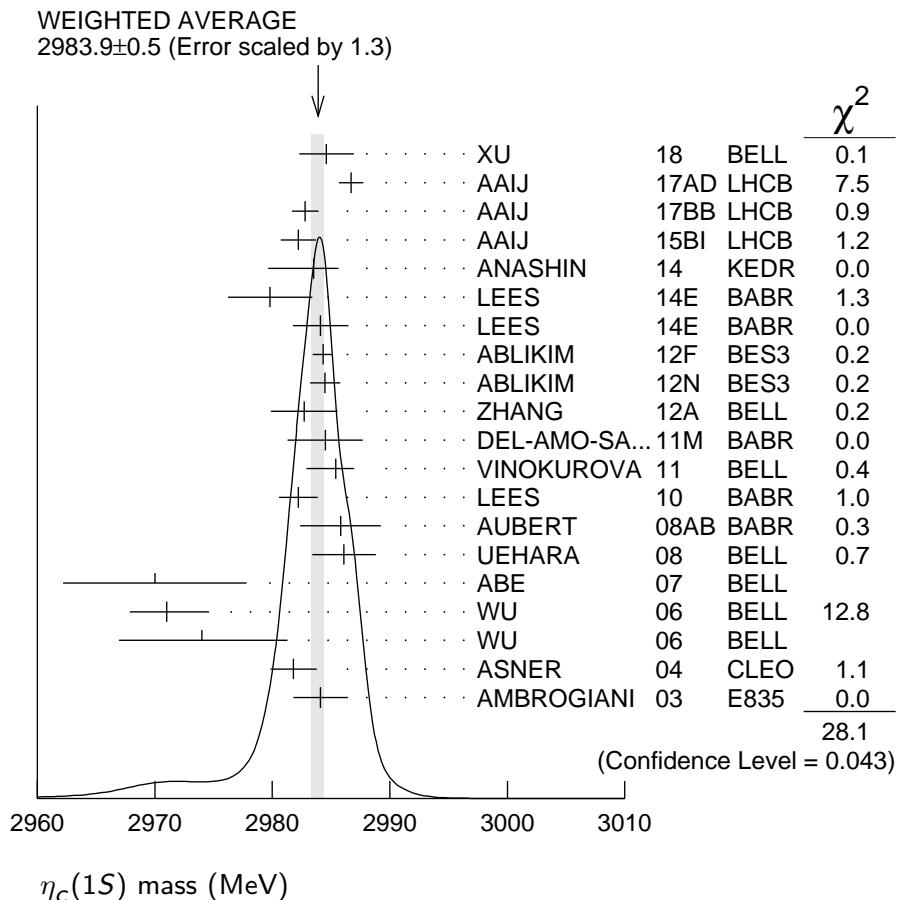

²⁰ Average of several decay modes. Using an η_c width of 13.2 MeV.

²¹ Superseded by ASNER 04.

²² Average of several decay modes.

²³ $\eta_c \rightarrow \phi\phi$.

²⁴ Mass adjusted by us to correspond to $J/\psi(1S)$ mass = 3097 MeV.

CONSTRAINED FIT INFORMATION

An overall fit to the total width, 8 combinations of partial widths obtained from integrated cross section, and 19 branching ratios uses 89 measurements and one constraint to determine 13 parameters. The overall fit has a $\chi^2 = 120.0$ for 77 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta p_i \delta p_j \rangle / (\delta p_i \cdot \delta p_j)$, in percent, from the fit to parameters p_i , including the branching fractions, $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$. The fit constrains the x_i whose labels appear in this array to sum to one.
